# Harmony

## Discover Harmony

Advanced operator interface and industrial relays

Harmony operator interface and industrial relays enhance operational efficiency and equipment availability across industrial and building applications. **Harmony** includes intelligent connected products and edge terminals that visualize, gather and process data, enabling informed operator decisions.

# Zelio Control Relays

## Near Field Communication and conventional Control Relays

### Zelio Control Relays

Zelio Control relays monitor and detect abnormal operating conditions concerning phase, current, voltage, frequency, speed, or temperature. The relays inform users of abnormal conditions, and allow them to initiate the necessary corrective actions before serious and costly breakdowns can occur. By monitoring energy network statuses, they enable both electrical and mechanical load control.

RM17T, RMNF22, RM35L, RM17J Zelio Control Relays

They are suitable for a wide range of applications:

- Hoisting: construction cranes, harbor cranes
- Packaging: motor voltage, current overload
- Lifts: construction lifts, passenger lifts, escalators
- Textile: motor voltage, current overload
- Water: liquid level on water tank at water and waste water recycling plant

Depending on the product model, control relays are categorized into 8 product families:

- 3-phase control
- Current control
- Voltage control
- Frequency control
- Speed control
- Lift temperature control
- Level control
- Pump control

### Zelio Control relay functions

#### Monitoring

Control relays monitor physical and electrical values. They measure variable signals such as phase (presence, sequence and symmetry), voltage, current, and frequency. They also control liquid levels and process operating rates.

#### Informing

Control device outputs provide users with electrical information. In addition, setting faults are signaled by simultaneous flashing of all LEDs.

#### Protecting

Integrated in the control circuits of automated systems, they enable automatic shutdown management and provide fault information, thus protecting the equipment.

#### Managing

When the power is switched on, the control relays are inhibited to enable correct measurement circuit setting. The outputs operate with positive logic, the contact or contacts being closed under normal conditions and opening as soon as a fault or power supply loss is detected.

#### Commissioning

When the diagnostic button is used, the downstream circuit can be closed immediately without sending a fault input signal to the relays. This shortens the testing time during commissioning and troubleshooting.

## Zelio Control relays with unique design and features

- > Compact modular sizes: 17.5 mm/0.69 in., 22.5 mm/0.88 in., 35 mm/1.38 in.
- > Adapted for industrial and building control panels
- > True RMS measurement that minimizes the possibility of unexpected trips from highly polluted networks (except RM17TG and RM22TG)
- > Diagnostic button to check the downstream circuit immediately and reduce commissioning and troubleshooting time (1)
- > IP50 lead-sealable settings protection cover helps prevent dust and unintended human intervention
- > Status indication by LEDs, additional dial pointer LED for easy setup in dark conditions (1), and power "On" status indication when relay is ready to perform

- > Optimization of power supplies
- > Worldwide certification:

## Zelio Control relay with NFC (2) technology

### Simplify product selection

- > One product reference with 7 control functions: Phase loss, Phase sequence, Asymmetry, Overvoltage, Undervoltage, Overfrequency, and Underfrequency

### Achieve unprecedented accuracy

- > Digitized setting eliminate the need for screw driver
- > Timed delay can be set by minute, second or millisecond

### Fault diagnosis

- > Fault status indication by LEDs
- > Real time fault analysis and Historical fault data are viewable in APP

### Superior security

- > 4 digit password protection

(1) Available in RM35JA32MR, RM35JA32MT, and all RM22 references.  
(2) Near Field Communication

# Zelio Control Relays

3-phase supply control relays  
RM17TG

RM17TG00

## Presentation

RM17TG●0 measurement and control relays for 3-phase supplies monitor the correct sequencing of phases L1, L2, and L3 and the total loss of two or more of these phases.

Functions	RM17TG
Sequence of phases L1, L2, and L3	
Phase loss	

- Function performed
- Function not performed

Depending on the model, RM17TG control relays:

- Accept different nominal 3-phase voltage values
- 208...480 V ~ for RM17TG00
- 208...440 V ~ for RM17TG20
- Are designed for clip-on mounting on a 35 mm rail

The control status is indicated by an LED.

## Applications

- Control for connection of moving equipment (site equipment, agricultural equipment, refrigerated trucks)
- Control against reverse motor operation (lifting, handling, elevators, escalators, etc.)
- Control of sensitive 3-phase supplies
- Emergency power supply switching in abnormal conditions

## Description

### RM17TG00 , RM17TG20

- 1 Spring for clip-on mounting on 35 mm/1.38 in. rail

R Yellow LED: indicates relay output status

### Operating principle

3-phase supply control relays monitor:

- Correct sequencing of phases L1, L2, and L3
- Fault signaling by LEDs
- Total loss of two or more of the phases

#### Function Diagram

- Output 11-14, 21-24 open
- Output 11-14, 21-24 closed

### RM17TG●0

#### Phase control

- Sequence of phases L1, L2, and L3
- Phase loss

The relays monitor:

- That the phase sequence and voltages are correct (> 183 V), the output relay(s) is/are closed and the yellow LED is on.
- If a sequencing fault or total loss of two or more phases is detected (detected as soon as two of the voltages drops below 100 V), the relay opens instantly and the LED goes off.
- On energization of the device with a detected measured fault, the relay stays open.

**Note:** *Tr*: response time on detection of a fault

RMNF22

Zelio NFC Control Relay

Zelio NFC control relay with Smartphone mobile app

### Presentation

The Near Field Communication (NFC) control relay is designed to monitor the following functions in 3-phase power networks and upon detection of faults, the relay contacts can be opened or closed with or without a set timing period.

- Sequence of phases (L1, L2, L3, N)
- Phase loss
- Asymmetry
- Undervoltage
- Overvoltage
- Under-frequency
- Over-frequency

NFC control relay provides simplified product selection and inventory management. It monitors 3-phase or 3-phase + neutral networks with 4 indication LEDs that display exact faults occurred during the process.

The mobile app, Zelio NFC, is Android enabled and can be downloaded onto your phone from Google Play. With this mobile app, accurate parameter settings can be achieved and the 2 relay outputs can be individually configured.

### Applications

- Control against reverse motor operation (lifting, handling, elevators, escalators, etc.)
- Control of sensitive 3-phase supplies
- Emergency power supply switching in abnormal conditions
- HVAC and pumping control panels

### Description

#### RMNF22

- 1 Pairing Indication LED
- 2 Phase Loss (PL) fault indication LED (Red continuous) or Phase Sequence (PS) fault indication LED (Red blinking)
- 3 Undervoltage (UV) fault indication LED (Red continuous) or Overvoltage (OV) fault indication LED (Red blinking)
- 4 Asymmetry (Asym) fault indication LED (Red continuous)
- 5 Under-frequency (UF) fault indication LED (Red continuous) or Over-frequency (OF) fault indication LED (Red blinking)
- 6 Output 2 indication LED (Amber)
- 7 Output 1 indication LED (Amber)
- 8 Power Supply indication LED (Green)
- 9 NFC antenna location

### Zelio NFC control relay mobile application

To use NFC control relay, an Android phone with NFC feature and Android OS (version 4.4 and above) are required. The Zelio NFC app can be downloaded in the mobile with one of the following methods:

- Align the mobile phone NFC antenna to the product NFC antenna. This will take you to the Google Play page for downloading the app.
- Go to Google Play  and search for "Zelio NFC".
- Scan the below QR code to download the Zelio NFC app.

With Zelio NFC App installed in your mobile device, you can retrieve/configure and lock/unlock the product settings, and diagnose product status. The related function diagrams, wiring diagram and Quick Start Guide can be obtained from the app.

They feature:

- Read, write, clone settings
- Easy auto-configure settings
- Configuration of up to 10 alarms with different monitoring functions
- Alarm combination with logic (AND, OR, NOT) for relay output
- User defined positive & negative logic (relay output)
- Simulator to check logic validity in alarm combination
- Diagnose feature for displaying historical faults through event logging
- Share settings via multiple channels depending on the phone (email, WhatsApp, etc.)
- Secured with password protection

### Operating principle

#### RMNF22

#### Phase loss + Phase sequence

Alarm triggered  
 Alarm not triggered

The relay monitors its own supply voltage  $U_n$ :

- Correct sequence of three phases
- Phase loss of at least one of the three phases
- Phase loss or phase sequence values can be set individually using the app.
- If a sequencing or phase loss fault is detected, the relay output opens or closes based on user Alarm settings in app.

**Note:**  $T_r$ : response after crossing of threshold (< 300 ms)

#### Undervoltage + Overvoltage

Alarm triggered  
 Alarm not triggered

The relay monitors its own supply voltage  $U_n$ :

- Under Voltage or Over Voltage
- An adjustable time delay on threshold crossing provides immunity to transients, and helps prevent spurious triggering of the output relay.
- If a voltage fault is detected, the relay opens or closes at the end of time delay set as On-delay or Off-delay by the user through the app.

**Note:**  $T_t$ : time delay after crossing of threshold (adjustable in Zelio NFC app)

#### Asymmetry

Alarm triggered  
 Alarm not triggered

The relay monitors its own supply voltage  $U_n$ :

- Asymmetry
- If an asymmetry fault is detected, the relay opens or closes at the end of time delay set by the user through the app.

**Note:**  $T_t$ : time delay after crossing of threshold (adjustable in Zelio NFC app)

#### Under-frequency + Over-frequency

Alarm triggered  
 Alarm not triggered

The relay monitors its own supply voltage  $U_n$ :

- Under-frequency or Over-frequency
- If a frequency value exceeding the threshold is detected, the relay opens or closes at the end of the time delay set as On-delay or Off-delay by the user through the app.

**Note:**  $T_t$ : time delay after crossing of threshold (adjustable in Zelio NFC app)

### Alarm combination using Boolean logic

With Zelio NFC App, it is possible to combine different alarms using AND, OR and NOT logic to form unique monitoring combinations for each of the relay outputs. A Simulator is also available to verify the validity of the overall logic.

RM22T●●●

## Presentation

RM22 multifunction Zelio control relays monitor the following functions on 3-phase supplies:

Functions	RM22TA	RM22TU	RM22TR	RM22TG
Sequence of phases L1, L2, and L3				
Phase loss				
Asymmetry				
Undervoltage				
Overtoltage and undervoltage				

■ Function performed  
□ Function not performed

Depending on the model, RM22T●●● control relays:

- Accept different nominal 3-phase voltages: up to 480 V~
- Monitor their own power supply measured as a true rms value (except RM22TG)
- Are designed for clip-on mounting on a rail

They feature a:

- Sealable cover to help protect the settings
- Diagnostic button for load circuit testing
- Relay output status LED
- Fault detection indication LED
- Dial pointer LED indicator for relay power ON status
- Relay output On-delay or Off-delay

## Applications

- Control for connection of moving equipment (site equipment, agricultural equipment, refrigerated trucks)
- Control against reverse motor operation (lifting, handling, elevators, escalators, etc.)
- Control of sensitive 3-phase supplies
- Emergency power supply switching in abnormal conditions

## Description

### RM22TA, RM22TU, RM22TR, RM22TG

- 1a Voltage range selector switch
- 1b Voltage range/On-Off delay selector
- 2 Time delay adjustment potentiometer Tt
- 3a Asymmetry threshold setting potentiometer Asym
- 3b Undervoltage setting potentiometer <U
- 3c Overtoltage setting potentiometer >U
- 4 Diagnostic button

## Operating principle

Multifunction 3-phase supply control relays monitor:

- Product being powered by L1 and L3
- Correct sequencing of phases L1, L2, and L3
- LED indication for relay output status and fault detection (except phase disconnection)
- Phase loss, including in the case of voltage regeneration
- Undervoltage from - 2...- 20% of the supply voltage Un
- Overtoltage from 2...20% of the supply voltage Un
- Asymmetry from 5...15% of the supply voltage Un

### Function Diagram

- Output 11-14, 21-24 open
- Output 11-14, 21-24 closed

Voltage switch operation:

- Set the switch to 3-phase supply voltage Un.
- The position of this switch is taken into account on energization of the device.
- If the switch position is changed while the device is operating, all the LEDs flash but the product continues to operate normally with the voltage selected at the time of energization preceding the change of position.
- If the switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

Un Green LED: indicates that supply to the product is on  
R Yellow LED: indicates relay output status  
DEF Yellow LED: indicates fault detection

## Operating principle (continued)

### RM22TA

#### Phase + Asymmetry

- Sequence of phases L1, L2, and L3
- Phase loss
- Asymmetry **Asy**

The relay monitors its own supply voltage  $U_n$ :

- correct sequence of three phases
- phase loss of at least one of the three phases ( $U$  measured  $< 150$  V (RM22TA31) and  $< 250$  V (RM22TA33))
- asymmetry adjustable from 5...15% of  $U_n$
- If a sequencing or phase loss fault is detected, the relay opens instantly.
- If an asymmetry fault is detected, the relay opens at the end of the time delay set by the user.
- On energization of the device with a detected measured fault, the relay stays open.

**Note:**  $T_t$ : time delay after crossing of the threshold (adjustable on the front panel)

### RM22TU

#### Phase + Undervoltage

- Sequence of phases L1, L2, and L3
- Phase loss

The relay monitors its own supply voltage  $U_n$ :

- correct sequence of the three phases
- phase loss of at least one of the three phases ( $U$  measured  $< 150$  V (RM22TU21) and  $< 250$  V (RM22TU23))
- undervoltage adjustable from -2...-20% of  $U_n$
- If a sequencing or phase loss fault is detected, the relay opens instantly.
- If a voltage fault is detected, the relay opens instantly.
- On energization of the device with a detected measured fault, the relay stays open.

- Undervoltage control  $<U$

**Note:**  $T_t$ : time delay after crossing of the threshold

## Operating principle (continued)

### RM22TR

#### Phase + Undervoltage/overvoltage

- Sequence of phases L1, L2, and L3
- Phase loss

The relay monitors its own supply voltage  $U_n$ :

- phase loss ( $U$  measured  $< 150$  V (RM22TR31) and  $< 250$  V (RM22TR33))
- undervoltage and overvoltage

- An adjustable time delay on threshold crossing provides immunity to transients, and helps prevent spurious triggering of the output relay.
- If a voltage fault is detected, the relay opens at the end of the time delay set as On-delay or Off-delay by the user.
- On energization of the device with a detected measured fault, the relay stays open.
- In the event of phase loss, the relay opens instantly.

- Overvoltage and undervoltage (Off-delay)

**Note:**  $T_t$ : time delay after crossing of the threshold (adjustable on the front panel)

### RM22TG

#### Phase control

- Sequence of phases L1, L2, and L3
- Phase loss

The RM22TG relay monitors:

- correct sequencing of the three phases
- total loss of two or more of the three phases
- When the phase sequence and voltages are correct ( $> 183$  V $\sim$ ), the output relays are closed and the R LED is on.
- When there is a sequencing fault or total loss of two or more phases (detected as soon as one of the voltages drops below 100 V) the relay opens instantly and the R LED goes off.
- On energization of the device with a detected measured fault, the relay stays open.

**Note:**  $T_r$ : response time on appearance of a fault

RM17T•00

## Presentation

RM17TT, RM17TA, RM17TU and RM17TE multifunction control relays monitor the following on 3-phase supplies:

Functions	RM17TT	RM17TA	RM17TU	RM17TE
Sequence of phases L1, L2, and L3				
Phase loss	(1)			
Asymmetry				
Undervoltage				
Overtoltage and undervoltage				

■ Function performed  
■ Function not performed

Depending on the model, RM17T•00 control relays:

- Accept different nominal 3-phase voltages: 208...480 V ~
- Monitor their own power supply measured as a true rms value
- Are designed for clip-on mounting on a 35 mm / 1.38 in. rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

## Applications

- Control for connection of moving equipment (site equipment, agricultural equipment, refrigerated trucks)
- Control against reverse motor operation (lifting, handling, elevators, escalators, etc.)
- Control of sensitive 3-phase supplies
- Emergency power supply switching in abnormal conditions

## Description

### RM17TT00, RM17TA00, RM17TU00, RM17TE00

- 1 Voltage range selector switch (208, 220, 380, 400, 415, 440, and 480 V ~)

RM17TE00

**Un** Green LED: indicates that supply to the product is on  
**R** Yellow LED: indicates relay output status

(1) Phase loss with regeneration.

## Operating principle

3-phase supply control relays monitor:

- Correct sequence of phases L1, L2, and L3
- Phase loss, including voltage regeneration
- Undervoltage from -2...-20% of the supply voltage  $U_n$
- Overvoltage from 2...20% of the supply voltage  $U_n$
- Asymmetry from 5...15% of the supply voltage  $U_n$
- Fault signaling is by LED

### Function Diagram

- Output 11-14, 21-24 open
- Output 11-14, 21-24 closed

Voltage switch operation:

- Set the switch to the 3-phase supply voltage  $U_n$ .
- The position of this switch is taken into account on energization of the device.
- If the switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the voltage selected at the time of energization preceding the change of position.
- If the selector switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

### RM17TT00

#### Phase + Voltage regeneration

- Sequence of phases L1, L2, and L3
- Phase loss

The relay monitors:

- correct sequence of the three phases
- phase loss of at least one of the three phases ( $U$  measured  $< 0.7 \times U_n$ )
  - If a sequencing or phase loss fault is detected, the relay opens instantly.
  - On energization of the device with a detected measured fault, the relay stays open.

### RM17TA00

#### Phase + Asymmetry

- Sequence of phases L1, L2, and L3
- Phase loss
- Asymmetry **Asy**

The relay monitors:

- correct sequence of the three phases
- phase loss of at least one of the three phases ( $U$  measured  $< 150$  V)
- asymmetry adjustable from 5...15% of  $U_n$ 
  - If a sequencing or phase loss fault is detected, the relay opens instantly.
  - If an asymmetry fault is detected, the relay opens at the end of the time delay set by the user.
  - On energization of the device with a detected measured fault, the relay stays open.

**Note:**  $T_t$ : time delay after crossing of the threshold (adjustable on front panel).

## Operating principle (continued)

### RM17TU00

#### Phase + Undervoltage

- Sequence of phases L1, L2, and L3
- Phase loss

- Undervoltage control  $U <$

Tt: time delay after crossing of the threshold (adjustable on front panel)

The relay monitors:

- correct sequence of the three phases
- phase loss of at least one of the three phases ( $U$  measured  $< 150$  V)
- undervoltage adjustable from  $-2...-20\%$  of  $U_n$  ( $-2...-12\%$  in the range  $3 \times 208$  V  $\sim$  and  $-2...-17\%$  in the range  $3 \times 220$  V  $\sim$  due to the minimum voltage  $183$  V  $\sim$ )

- If a sequencing or phase loss fault is detected, the relay opens instantly.
- If a voltage fault is detected, the relay opens at the end of the time delay set by the user.
- On energization of the device with a detected measured fault, the relay stays open.

### RM17TE00

#### Phase + Asymmetry + Undervoltage/overvoltage

- Sequence of phases L1, L2, and L3
- Phase loss
- Asymmetry  $Asy$

Tt: time delay after crossing of the threshold (adjustable on front panel)

The relay monitors:

- correct sequence of the three phases
- phase loss of at least one of the three phases ( $U$  measured  $< 150$  V)
- asymmetry adjustable from  $5...15\%$  of  $U_n$
- the overvoltage and undervoltage difference in window mode, adjustable from  $2...20\%$  of  $U_n$

$U_n$	208 V	220 V	380, 400, 415, 440 V	480 V
Voltage	$< -12...-2$	$-17...-2$	$-20...-2$	$-20...-2$
threshold (%)	$> +2...+20$	$+2...+20$	$+2...+20$	$+2...+10$

- If a sequencing or phase loss fault is detected, the relay opens instantly.
- If an asymmetry or voltage fault is detected, the relay opens at the end of the time delay set by the user.
- On energization of the device with a detected measured fault, the relay stays open.

- Control of overvoltage and undervoltage in window mode  $U > / U <$

Tt: time delay after crossing of the threshold (adjustable on front panel)

	< U (%)	- 12...- 2	- 17...- 2	- 20...- 2	- 20...- 2
RM35UB30	> U (%)	-	+ 2...+ 20	+ 2...+ 20	+ 2...+ 10
	< U (%)	-	- 12...- 2	- 20...- 2	- 20...- 2
Un Phase/neutral		120 V	127 V	220, 230, 240, 260 V	277 V
RM35UB3N30	> U (%)	+ 2...+ 20	+ 2...+ 20	+ 2...+ 20	+ 2...+ 20
	< U (%)	- 20...- 2	- 20...- 2	- 20...- 2	- 20...- 2

- Phase loss

- Presence of neutral (RM35UB3N30 only)

- Measurements are made between Phases for RM35UB330 and RM17UB310 and between Phase/Neutral for RM35UB3N30

- Fault signaling is by LED

- RM35UB relays can differentiate between the source of the fault (one LED for overvoltage threshold, one LED for undervoltage threshold)

- Voltage switch operation:

- Set the switch to the 3-phase supply voltage Un.

- The position of this switch is only taken into account on energization of the device.

- If the switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the voltage selected at the time of energization preceding the change of position.

- If the switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

### RM35UB330

#### Overvoltage/undervoltage control

- Phase loss

- Overvoltage and undervoltage

- The relay monitors:

- phase loss (U measured < 150 V)
- the undervoltage
- the overvoltage

- Each threshold has its own independently adjustable time delay from 0.3 to 30 s.

- If a voltage fault is detected, the corresponding relay (one undervoltage output/one overvoltage output) opens at the end of the time delay set by the user.

- If a phase loss is detected, both relays open instantly without waiting for the end of the time delay set by the user.

- On energization of the device with a detected measured fault, the relays stay open.

**Note:** Tt 1: overvoltage threshold delay (adjustable on front panel)  
Tt 2: undervoltage threshold delay (adjustable on front panel)

### Operating principle (continued)

#### RM35UB3N30

##### Overvoltage/undervoltage + absence of neutral control

□ Phase loss

□ Overvoltage and undervoltage

■ The relay monitors:

- presence of the neutral
- the undervoltage
- the overvoltage
- phase loss (U measured < 80 V)

■ Each threshold has its own independently adjustable time delay from 0.3 to 30 s.

■ If a voltage fault is detected, the corresponding relay (one undervoltage output/one overvoltage output) opens at the end of the time delay set by the user.

■ In the absence of either neutral or phase, both relays open instantly without waiting for the end of the time delay set by the user.

■ On energization of the device with a detected measured fault, the relays stay open.

*Note: Tt 1: overvoltage threshold delay (adjustable on front panel)  
Tt 2: undervoltage threshold delay (adjustable on front panel)*

#### RM17UB310

##### Overvoltage/undervoltage control

□ Phase loss

□ Overvoltage and undervoltage

■ The relay monitors:

- the undervoltage
- the overvoltage
- phase loss (U measured < 150 V)

■ An adjustable time delay from 0.3 to 30 s allows inhibition of the output relay if a transient fault occurs.

■ If a voltage fault is detected, the relay opens at the end of the time delay set by the user.

■ On energization of the device with a detected measured fault, the relay stays open.

■ If phase loss is detected, the relay opens instantly.

*Note: Tt: overvoltage and undervoltage threshold delay (adjustable on front panel)*

## Zelio Control Relays

3-phase supply and motor temperature control relays  
RM35TM

RM35TM50MW

RM35TM250MW

### Presentation

RM35 Zelio multifunction control relays monitor the following functions on 3-phase supplies:

Functions	RM35TM50MW	RM35TM250MW
Sequence of phases L1, L2, and L3		
Phase loss		
Motor temperature via PTC probe		
Selection (with or without memory)		
Test/Reset button		

- Function performed
- Function not performed

Depending on the model, control relays:

- Accept different nominal 3-phase voltages: 208...480 V ~
- Have phase and temperature control functions that are independent of one another
- Detect line breaks or short-circuit of the temperature probes
- Selection (with or without memory) and Test/Reset function is available
- Are designed for clip-on mounting on a 35 mm rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

### Applications

- Control for connection of moving equipment (site equipment, agricultural equipment, refrigerated trucks)
- Control against reverse motor operation (lifting, handling, elevators, escalators, etc.)
- Control of sensitive 3-phase supplies
- Emergency power supply switching in abnormal conditions

### Description

#### RM35TM50MW, RM35TM250MW

- 1 Spring for clip-on mounting on 35 mm/1.38 in. rail
- 2 Temperature contact (11-14)
- 3 Phase contact (21-24)
- 4 Configuration: selection of temperature control operating mode (with or without memory) **Memory - No Memory**
- 5 Pushbutton (activation of temperature control) **Test/Reset**

RM35TM50MW

RM35TM250MW

<V> Yellow LED: relay output status indicator

Un Green LED: power ON indicator

Yellow LED: relay output status indicator

### Operating principle

Relays RM35TM50MW and RM35TM250MW monitor:

- Status of the 3-phase supply
- Temperature of motors with embedded PTC probes

The 3-phase supply control function monitors:

- Correct sequence of phases L1, L2, and L3
- Phase loss

#### Function Diagram

-  Power supply off
-  Power supply on
-  Output 11-14, 21-24 open
-  Output 11-14, 21-24 closed

### RM35TM50MW/RM35TM250MW

#### 3-phase supply control

- Sequence of phases L1, L2, and L3
- Phase loss

- As soon as phase sequence (L1, L2, and L3) and phase presence are considered to be correct, the output relay contact closes and LED R2 is lit.
- If total failure or drop in amplitude of a phase (U measured < 100 V) or inversion of phase sequence is detected, the output relay contact opens and LED R2 goes out.
- The result of the control is indicated by the status of output relay R2, NO contact 21-24 is open in the event of a fault.

#### Temperature control

- Motor temperature control via PTC probe

- The temperature control relay can take up to 6 PTC (positive temperature coefficient) probes wired in series between terminals T1 and T2.
- A fault is declared when the resistance of the temperature sensing circuit exceeds 3100 Ω.
- Return to normal status is detected when the resistance is once again below 1650 Ω.
- The result of the control is indicated by the status of the “temperature” output relay, NO contact 11-14 is open in the event of a fault.
- Opening of the thermal sensing circuit, which has the same effect as a high temperature (resistance exceeds 3100 Ω), is therefore interpreted as a fault.
- Total short-circuiting of the temperature probe(s), detected when resistance is less than 15 W ± 5 W, is treated as a fault.
- LED R1 is on when the temperature is correct.

## Operating principle (continued)

### RM35TM250MW

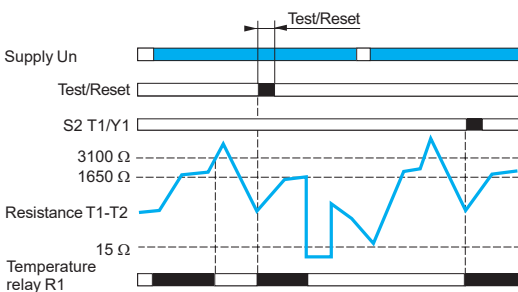

#### Configuration

This configuration is considered when relay RM35TM250MW is energized.

- Set the switch to the required operating mode:
  - Temperature control without memory
  - Temperature control with memory
- On energization, placing the switch in one of the five intermediate positions holds the relay in the open contact state and the detected error is signaled by simultaneous flashing of the LEDs.
- The position of the mode selector switch is taken into account on energization.
- Any modification of its position during operation has no effect - the active configuration may therefore be different from that indicated by the switch - the RM35TM250MW operates normally but the change in configuration is signaled by simultaneous flashing of the three LEDs.

#### Motor temperature control via PTC probe with memory

- Memory

- Relay RM35TM250MW has a selector switch which allows the temperature control operating mode to be configured with or without memory.
- In “memory” mode, when a fault is detected, the “temperature” relay locks in the open position.
- As soon as the temperature returns to the correct value, the relay can be unlocked (reset), either by pressing the “Test/Reset” button (for at least 200 ms), or by closing a volt-free contact (for at least 200 ms) between terminal Y1 and T1 (without a parallel load).
- Relay RM35TM250MW can also be reset by switching off the power (see reset time).

#### Use of “Test/Reset” button

- No Memory

- Relay version RM35TM250MW has a “Test/Reset” button which can be used to check that the temperature control function is working correctly and to reset this function after locking in “memory” mode.
- The press and release times are 50 ms for both functions.
- When the temperature is normal, pressing the “Test/Reset” button simulates overheating, the “temperature” output relay contact is open and the <V< LED is off.
- If “memory” mode is not active, “fault” indication is maintained for as long as the button is pressed.
- If “memory” mode is active, “fault” indication is locked and the button needs to be released and pressed again to reset the function.
- In “memory” mode, when a fault has been detected and the temperature has returned to normal, the “temperature” control relay can be unlocked (reset) by pressing the “Test/Reset” button.

- Memory

RM17UBE10

Un Green LED: indicates that supply to the product is on  
R Yellow LED: indicates relay output status

### Operating principle

Voltage control relays RM17UAS (except RM17UAS15315M) and RM17UBE monitor:

- Voltage of 1-phase and DC supplies
- RM17UAS●● relays support two operating modes:
  - Overvoltage or undervoltage
  - Fault memory selected or not
- An adjustable time delay, on crossing the thresholds, provides immunity to transients, and helps prevent spurious triggering of the output relay
- Fault signaling is by LED

#### Function Diagram

	Power supply off
	Power supply on
	Output 11-14, 21-24 open
	Output 11-14, 21-24 closed

### RM17 UAS14/UAS15/UAS16 (except RM17UAS15315M)

The operating mode is determined by a switch:

- Undervoltage with or without memory
- Overvoltage with or without memory

The position of the configuration switch and the operating mode is read by the product on energization:

- If the configuration switch is set to an unacceptable position, the product detects a fault, the output relay stays open and the LEDs flash to indicate the position error.
- If the switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

The undervoltage or overvoltage threshold value is set by a graduated potentiometer clearly indicating the voltage **Un** to be monitored. The hysteresis is adjusted by a potentiometer graduated from 5...20% of the threshold setting. The hysteresis value must not exceed the limit values of the measuring range.

### Undervoltage/Overvoltage without memory

#### □ Undervoltage control $U <$ , No Memory

If the controlled voltage falls below the threshold setting for a time greater than that set on the front panel (0.1...10 s), the output relay opens and the R LED goes off. As soon as the voltage returns to a value above (or below) the threshold setting minus (or respectively plus) the hysteresis, the relay instantly closes.

#### □ Overvoltage control $U >$ , No Memory

If the controlled voltage exceeds the threshold setting for a time greater than that set on the front panel (0.1...10 s), the output relay opens and the R LED goes off. As soon as the voltage returns to a value below the threshold setting plus the hysteresis, the relay instantly closes.

## Operating principle (continued)

### RM17 UAS14/UAS15/UAS16 (except RM17UAS15315M) (continued)

#### Undervoltage/Overvoltage with memory

Undervoltage control  $U <$ , Memory

If “Memory” mode is selected, the relay opens when crossing of the threshold is detected and then stays in that position. The power needs to be switched off to reset the product.

Overvoltage control  $U >$ , Memory

**Note:**  $Tt$ : time delay after crossing of the threshold

### RM17 UBE15/UBE16

#### Overvoltage + undervoltage control in window mode

These relays operate in window mode where they check that the controlled voltage stays between a minimum threshold and a maximum threshold.

- The undervoltage or overvoltage threshold values are set by two graduated potentiometers clearly indicating the voltage  $U_n$  to be monitored. The hysteresis is fixed at 3% of the threshold setting.
- If the controlled voltage exceeds the high threshold setting, or falls below the low threshold setting for a time greater than that set on the front panel (0.1...10 s), the output relay opens and the R LED goes out. During the time delay, this LED flashes.
- As soon as the voltage falls below the high threshold setting value minus the hysteresis, or rises above the low threshold setting value plus the hysteresis, the relay instantly closes.
- On energization of the device with a detected measured fault, the relay stays open.

**Note:**  $Tt$ : time delay after crossing of the threshold

### RM17UAS15315M

#### Undervoltage

If the controlled voltage falls below the threshold (165 V  $\sim$ ), the output relay instantly opens and the R LED goes out. As soon as the voltage returns to a value above the threshold plus the hysteresis, the relay closes after the time set on the front panel (3...15 min).

**Note:**  $Tt$ : time delay after crossing of the threshold

## Presentation

Multifunction voltage control relays RM35UA1 MW monitor both AC and DC voltages.

Functions	RM35UA11MW	RM35UA12MW	RM35UA13MW
Overvoltage or undervoltage (with or without memory)			
Range controlled	0.05...5 V	1...100 V	15...600 V

- Function performed
- Function not performed

Depending on the model, the control relays allow:

- Automatic  $\overline{\sim}$  or  $\sim$  recognition
- Measurement ranges from 0.05 V to 600 V
- Selection between overvoltage and undervoltage
- Measurement as a true rms value
- Selectable memory function
- Clip-on mounting on a  $\overline{\text{L}}$  rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

## Applications

- DC motor overspeed control
- Battery monitoring
- Monitoring of AC or DC supplies
- Speed monitoring (with tacho-generator)

## Description

### RM35 UA11MW/UA12MW/UA13MW

- 1 Configuration: selection of operating mode  $<U / >U$ , (with or without memory)  
**Memory - No Memory**
- 2 Voltage threshold setting potentiometer **U Value**
- 3 Hysteresis adjustment potentiometer **H**
- 4 Time delay setting potentiometer **Tt**
- 5 Spring for clip-on mounting on 35 mm / 1.38 in.  $\overline{\text{L}}$  rail

## Operating principle

Multifunction voltage relays RM35UA1 MW:

- Automatically recognize the form of  $\overline{\sim}$  or  $\sim$  (50 or 60 Hz) signal
- Fault signaling is by LED

### Function Diagram

- Power supply off
- Power supply on
- Output 11-14, 21-24 open
- Output 11-14, 21-24 closed

### RM35 UA11MW/UA12MW/UA13MW

The operating mode is selected by using a switch:

- Undervoltage with or without memory
- Overvoltage with or without memory

The position of the switch and the operating mode is read by the product on energization:

- If the switch is set to an unacceptable position, the product detects a fault, the output relay stays open and the LEDs flash to indicate the position error.
- If the switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

The undervoltage or overvoltage threshold value is set by a potentiometer graduated as a percentage of the scale value of **Un** to be monitored. The hysteresis is adjusted by a potentiometer graduated from 5...50% of the threshold setting. The hysteresis value must not exceed the limit values of the measuring range.

## Operating principle (continued)

### RM35 UA11MW/UA12MW/UA13MW

#### Overvoltage without memory

■ Overvoltage control  $> U$ , without memory

If the voltage controlled exceeds the threshold setting for a time greater than that set on the front panel (0.3...30 s), the output relay opens and the **R** LED goes off. During the time delay, this LED flashes. As soon as the voltage drops below the value of the threshold setting, minus the hysteresis, the relay instantly closes.

**Note:**  $T_t$ : time delay after crossing of the threshold (adjustable on front panel)

#### Undervoltage without memory

■ Undervoltage control  $< U$ , without memory

If the voltage controlled falls below the threshold setting for a time greater than that set on the front panel (0.3...30 s), the output relay opens and the **R** LED goes off. During the time delay, this LED flashes. As soon as the voltage rises above the value of the threshold setting plus the hysteresis, the relay instantly closes.

**Note:**  $T_t$ : time delay after crossing of the threshold (adjustable on front panel)

#### Overvoltage/undervoltage with memory

■ Undervoltage control  $< U$ , with memory

If "Memory" mode is selected, the relay opens when crossing of the threshold is detected and then stays in that position. The power needs to be switched off to reset the product.

■ Undervoltage control  $< U$ , with memory

**Note:**  $T_t$ : time delay after crossing of the threshold (adjustable on front panel)

RM22UB34

R Yellow LED: indicates relay output status

### Operating principle

- 1-phase voltage control relays monitor:
- the voltage of 1-phase and DC supplies
  - their own supply voltage for the RM22UB model

An adjustable time delay on threshold crossing, provides immunity to transients, and helps prevent spurious triggering of the output relay.

#### Function Diagram

-  Power supply off
-  Power supply on
-  Output 11-14, 21-24 open
-  Output 11-14, 21-24 closed

### RM22 UA2•MR/UA3•MR/UA33MT

The operating mode is determined by the user:

- Undervoltage with or without memory
- Overvoltage with or without memory

The position of the configuration switch and the operating mode is read by the product on energization:

- If the configuration switch is set to an unacceptable position, the product detects a fault, the output relay stays open, and the LEDs flash to indicate the position error.
- If the configuration switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the position change.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

The undervoltage or overvoltage threshold value is set by means of a potentiometer graduated as a percentage of the scale value of U to be monitored. The hysteresis is adjusted by means of a potentiometer graduated from 5...50% of the threshold setting. The hysteresis value must not exceed the limit values of the measuring range.

### Overvoltage without memory

- Overvoltage control  $> U$ , without memory

If the controlled voltage exceeds the threshold setting for a time greater than that set on the front panel (0.1...30 s), the output relay opens and the R LED goes off. During the time delay, this LED flashes.

As soon as the voltage drops below the value of the threshold setting minus the hysteresis, the relay instantly closes.

### Undervoltage without memory

- Undervoltage control  $< U$ , without memory

If the controlled voltage falls below the threshold setting for a time greater than that set on the front panel (0.1...30 s), the output relay opens and the R LED goes off. During the time delay, this LED flashes.

As soon as the voltage rises above the value of the threshold setting plus the hysteresis, the relay instantly closes.

## Operating principle (continued)

### RM22 UA2•MR/UA3•MR/UA33MT (continued)

#### Overvoltage/undervoltage with memory

- Overvoltage control  $> U$ , with memory

If "Memory" mode is selected, the relay opens when crossing of the threshold is detected and then stays in that position. The power has to be switched off to reset the product.

**Note:**  $T_t$ : time delay after crossing of the threshold

- Undervoltage control  $< U$ , with memory

### RM22 UA3•MR/UA33MT/UB34

#### Overvoltage + undervoltage control relay in window mode

- Overvoltage and undervoltage control in window mode  $<U<$

These relays operate in window mode where they check that the controlled voltage stays between a minimum and a maximum threshold.

- The undervoltage or overvoltage threshold values are set by means of two graduated potentiometers clearly indicating the  $U_n$  to be monitored. The hysteresis is fixed at 5% of the threshold setting.
- If the controlled voltage exceeds the high threshold setting or falls below the low threshold setting for a time greater than that set on the front panel (0.1...30 s), the output relay opens and the R LED goes off. During the time delay, this LED flashes.
- As soon as the voltage falls below the high threshold setting value minus the hysteresis, or rises above the low threshold setting value plus the hysteresis, the relay instantly closes.
- On energization of the device with a detected measured fault, the relay stays open.

**Note:**  $T_t$ : time delay after crossing of the threshold

**R** Yellow LED: indicates relay output status

### Presentation

The control relay **RM17JC00MW** is designed to monitor  $\sim$  currents.

Functions	RM17JC00MW
Overcurrent (without memory)	

- Function performed
- Function not performed

These control relays allow:

- Integrated current transformer
- Measurement range 2...20 A
- Choice of action on the output relay
- Clip-on mounting on a  $\sqcup$  rail

They feature a control status indicator LED.

### Applications

- Load state control of motors and generators
- Control of current drawn by a 3-phase motor
- Monitoring of heating or lighting circuits
- Control of pump draining (undercurrent)
- Control of overtorque (crushers)
- Monitoring of electromagnetic brakes or clutches

### Description

#### RM17JC00MW

- 1 Overcurrent setting potentiometer
- 2 Spring for clip-on mounting on 35 mm/1.38 in.  $\sqcup$  rail

## Operating principle

Control relay **RM17JC00MW** is:

- equipped with an integrated current transformer
- fault signaling is by LED

### Function Diagram

-  Power supply off
-  Power supply on

## RM17JC00MW

### Overcurrent detection

Overcurrent detection > I

- Relay **RM17JC00MW** controls overcurrent.
- The relay closes when the current exceeds the threshold setting on the front panel and opens when it drops below the threshold minus the hysteresis.
- When terminal Y1 is linked to A1 (+), the output is reversed. The relay opens when the current exceeds the threshold setting on the front panel and closes again when it drops below the hysteresis value.

RM22JA31MR

RM35JA32MR

RM35JA32MT

R Yellow LED: indicates relay output status

## Operating principle

Current control relays monitor the current of 1-phase and DC supplies.

An adjustable time delay on threshold crossing provides immunity to transients, helping prevent spurious triggering of the output relay.

### Function Diagram

	Power supply off
	Power supply on
	Output 11-14, 21-24 open
	Output 11-14, 21-24 closed

### RM22JA•1MR/RM35JA32M•

The operating mode is determined by the user:

- Undercurrent with or without memory
- Overcurrent with or without memory

The position of the configuration switch and the operating mode is read by the product on energization:

- If the configuration switch is set to an unacceptable position, the product detects a fault, the output relay stays open and the LEDs flash to indicate the position error.
- If the configuration switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

The undercurrent or overcurrent threshold value is set by means of a potentiometer graduated as a percentage of the scale value of  $I$  to be monitored. The hysteresis is adjusted by means of a potentiometer graduated from 5...50% of the threshold setting. The hysteresis value must not exceed the limit values of the measuring range.

### Overcurrent/Undercurrent without memory

- Overcurrent detection  $>I$ , without memory

If the controlled current exceeds the threshold setting for a time greater than that set on the front panel (0.1...30 s), the output relay opens and the R LED goes off. During the time delay, this LED flashes.

As soon as the current drops below the value of the threshold setting minus the hysteresis, the relay instantly closes.

- Undercurrent detection  $<I$ , without memory

If the controlled current falls below the threshold setting for a time greater than that set on the front panel (0.1...30 s), the output relay opens and the R LED goes off. During the time delay, this LED flashes.

As soon as the current rises above the value of the threshold setting plus the hysteresis, the relay instantly closes.

**Note:**  $T_t$ : time delay after crossing of the threshold

## Operating principle (continued)

### RM22JA•1MR/RM35JA32M• (continued)

#### Overcurrent/Undercurrent with memory

□ Overcurrent  $>I$ , with memory

If “Memory” mode is selected, the relay opens when threshold crossing is detected and then stays in that position. The power has to be switched off to reset the product.

□ Undercurrent  $<I$ , with memory

**Note:**  $T_t$ : time delay after crossing of the threshold

### RM22JA•1MR/RM35JA32M•

#### Overcurrent and undercurrent control in window mode

□ Overcurrent and undercurrent control in window mode  $<I<$ , without memory

These relays operate in window mode where they check that the controlled current stays between a minimum and a maximum threshold.

■ The undercurrent or overcurrent threshold values are set by means of two graduated potentiometers clearly indicating the  $I$  to be monitored. The hysteresis is fixed at 5% of the threshold setting.

■ If the controlled current exceeds the high threshold setting or falls below the low threshold setting for a time greater than that set on the front panel (0.1...30 s), the output relay opens and the R LED goes off. During the time delay, this LED flashes.

■ As soon as the current falls below the high threshold setting value minus the hysteresis, or rises above the low threshold setting value plus the hysteresis, the relay instantly closes.

■ On energization of the device with a detected measured fault, the relay stays open.

**Note:**  $T_t$ : time delay after crossing of the threshold

## Presentation

Multifunction current control relays RM35JA3●MW monitor both AC and DC currents.

Functions	RM35JA31MW	RM35JA32MW
Overcurrent (with/without memory)		
Undercurrent (with/without memory)		
Range controlled	2 ... 500 mA	0.15...15 A

  Function performed

  Function not performed

These control relays allow:

- Automatic AC or DC recognition
- Measurement ranges from 2 mA to 15 A
- Selection between overcurrent and undercurrent
- Measurement as a true rms value
- Selectable memory function
- Clip-on mounting on a 1/2 rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

## Applications

- Excitation control of DC machines
- Control of the load state of motors and generators
- Control of current drawn by a 3-phase motor
- Monitoring of heating or lighting circuits
- Control of pump draining (undercurrent)
- Control of overtorque (crushers)

**R** Yellow LED: indicates relay output status

## Operating principle

Control relays RM35JA3●MW are designed to:

- monitor  $\sim$  or  $\overline{\sim}$  currents
- automatically recognize the form of  $\overline{\sim}$  or  $\sim$  (50 or 60 Hz) signal
- directly monitor up to 15 A (above this value a current transformer can be connected)
- signal detected faults by means of LEDs

### Function Diagram

Power supply off

Power supply on

Output 11-14, 21-24 open

Output 11-14, 21-24 closed

## Operating principle (continued)

### RM35 JA31MW/JA32MW

The operating mode is selected by a switch:

- Undercurrent, with or without memory
- Overcurrent, with or without memory

The position of the switch and the operating mode is read by the product on energization:

- If the switch is set to an unacceptable position, the product detects a fault, the output relay stays open and the LEDs flash to indicate the position error.
- If the switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

The undercurrent or overcurrent threshold value is set by a potentiometer graduated as a percentage of the scale value of current  $I$  to be monitored. The hysteresis is adjusted by a potentiometer graduated from 5...50% of the threshold setting and the value must not exceed the limit values of the measuring range.

### Overcurrent without memory

- Overcurrent detection  $> I$ , without memory

If the current controlled exceeds the threshold setting for a time greater than that set on the front panel (0.3...30 s), the output relay opens and the LED goes off. As soon as the current drops below the value of the threshold setting minus the hysteresis, the relay instantly closes.

### Undercurrent without memory

- Undercurrent detection  $< I$ , without memory

If the current controlled falls below the threshold setting for a time greater than that set on the front panel (0.3...30 s), the output relay opens and the LED goes off. As soon as the current rises above the value of the threshold setting plus the hysteresis, the relay instantly closes.

### Overcurrent/Undercurrent with memory

- Overcurrent detection  $> I$ , with memory

If "Memory" mode is selected, the relay opens when crossing of the threshold is detected and then stays in that position. The power needs to be switched off to reset the product.

On energization, an inhibition time delay (1...20 s) makes it possible to inhibit current peaks (or troughs) on start-up of equipment.

- Undercurrent detection  $< I$ , with memory

**Note:**  $T_i$ : starting inhibition time (adjustable on front panel)  
 $T_t$ : time delay after crossing of the threshold (adjustable on front panel)

Liquid level control relays  
RM22LA and RM22LG

RM22LG11MR

RM22LA32MT

## Presentation

RM22LA and RM22LG liquid level control relays control one or two liquid levels, with a fill or empty function:

Functions	RM22LA 32MR/32MT	RM22LG 11MR/11MT
Level 1/Level 2		
Fill operation		
Empty operation		
Low sensitivity		
Standard sensitivity		
High sensitivity		

■ Function performed  
■ Function not performed

RM22 liquid level control relays feature:

- A dial pointer LED indicator for relay power ON status
- A relay output status LED
- A sealable cover to help protect the settings
- A control status indicator LED

The relays are designed for clip-on mounting on a 15 rail.

## Applications

These devices monitor the levels of conductive liquids.

They control the actuation of pumps or valves to regulate levels and can also help prevent submersible pumps "dry running", or tanks "overflowing". They can also be used to control dosing of liquids in mixing processes and to help protect heating elements in the event of non-immersion.

They have a transparent, hinged cover on their front panel to avoid any accidental alteration of the settings. This cover can be directly sealed.

■ Application examples for compatible liquids:

- spring, town, industrial, and sea water
- metallic salt, acid, or base solutions
- liquid fertilizers
- non-concentrated alcohol (< 40%)
- liquids in the food processing industry: beer, coffee, etc.

R Yellow LED: indicates relay output status

## Operating principle

Liquid level control relays are designed to measure and control the levels of conductive liquids by means of resistive probes.

The operating principle is based on measurement of the apparent resistance of the liquid between two submerged probes. When this value is less than the threshold setting on the front panel of the device, the relay changes state. To avoid electrolytic phenomena, an AC current runs across the probes.

A selector switch on the front panel allows selection of the required function and the sensitivity range. Control of a single level can be achieved by using the second selector switch. In this case, the Max. level probe stays up in the air and an adjustable time delay avoids any wave effect. Both products activate their output relay when a tank is either emptying or filling.

### Function Diagram

	Power supply Off
	Power supply On
	Output 11-14, 21-24 open
	Output 11-14, 21-24 closed

## RM22LA and RM22LG

A selector switch on the front panel of these relays allows selection of the required sensitivity range and the empty or fill function. A second switch allows selection of the number of levels (1 or 2) and the type of time delay in the case of level 1 mode. The position of these configuration switches is taken into account on energization.

- If the configuration switch is set to an unacceptable position, the product detects a fault, the output relay stays open, and the LEDs flash to signal the position error.
- If the configuration switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

## Control of two levels, empty and fill function

### □ Fill/Empty function (2 levels)

### ■ Empty function

level: 2, function:

-  **LS** (Low Sensitivity: 250 Ω...5 kΩ)
-  **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
-  **HS** (High Sensitivity: 50 kΩ...1 MΩ)

The output relay stays open until the liquid reaches the Max. level probe.

As soon as the Max. level is reached, the contact closes and then allows emptying of the tank (valve opens, pump starts, etc.). When the level drops below the Min. level, the contact opens to stop the emptying process.

### ■ Fill function

level: 2, function:

-  **LS** (Low Sensitivity: 250 Ω...5 kΩ)
-  **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
-  **HS** (High Sensitivity: 50 kΩ...1 MΩ)

The output relay stays energized until the liquid reaches the Max. level probe.

As soon as the Max. level is reached, the contact opens and the pump stops.

When the level drops below the Min. level, the contact closes again and pumping restarts to raise the level.

## Operating principle (continued)

### RM22LA and RM22LG (continued)

#### Control of one level, empty function

Empty function T on

■ Level: 1 - **on delay** functions:

-  **LS** (Low Sensitivity: 250 Ω...5 kΩ)
-  **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
-  **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level rises above the probe for a time greater than the time delay value  $T_t$  set on the front panel, the relay is energized and stays energized until the liquid level drops back to the probe.

If the liquid drops back below the set level before the end of the time delay, the relay is not energized.

Empty function T off

■ Level: 1 - **off delay** functions:

-  **LS** (Low Sensitivity: 250 Ω...5 kΩ)
-  **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
-  **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level rises above the probe, the relay is energized instantly and stays energized until the liquid again reaches the probe level for a time  $T_t$  set on the front panel.

If the liquid drops back below the set level before the end of the time delay period, the relay stays energized.

#### Control of one level, fill function

Fill function T on

■ Level: 1 - **on delay** functions:

-  **LS** (Low Sensitivity: 250 Ω...5 kΩ)
-  **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
-  **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level drops below the probe for a time greater than the time delay value  $T_t$  set on the front panel, the relay is energized and stays energized until the liquid level rises back up to the probe.

If the liquid rises back above the set level before the end of the time delay period, the relay is not energized.

Fill function T off

■ Level: 1 - **off delay** functions:

-  **LS** (Low Sensitivity: 250 Ω...5 kΩ)
-  **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
-  **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level drops below the probe, the relay is energized instantly and stays energized until the liquid level again reaches the probe level and stays above it for a time greater than the time delay period  $T_t$  set on the front panel.

If the liquid drops back below the set level before the end of the time delay period, the relay stays energized.

**Note:**  $T_t$ : time delay after crossing of the threshold

### RM35LV14MW

- 2 Configuration: selection of operating mode  $\sqrt{V}$  /  $\sqrt{V}$  and of sensor type PNP, NPN
- 3 Time delay adjustment potentiometer **Tt**
- 4 Switch for selecting the number of levels
- 5 Spring for clip-on mounting on 35 mm/1.38 in. rail

- Tt** Yellow LED: indicates timing status
- Un** Green LED: indicates that supply to the product is on
- R** Yellow LED: indicates relay output status

## Operating principle

Control relays RM35LM and RM35LV are designed to control the levels of:

- Conductive liquid for RM35LM (measures the levels by resistive probes)
- Any other material for RM35LV (controls the levels of conductive liquids)

### Function Diagram

- Power supply off
- Power supply on
- Output 11-14, 21-24 open
- Output 11-14, 21-24 closed

The operating principle is based on measurement of the apparent resistance of the liquid between two submerged probes. When this value is less than the threshold setting on the front panel of the device, the relay changes state. To avoid electrolytic phenomena, an AC current runs across the probes.

A selector switch on the front panel allows selection of the required function and the sensitivity range. Control of a single level can be achieved by using the second selector switch. In this case, the Max. level probe stays up in the air and an adjustable time delay avoids any wave effect.

## Operating principle

### RM35LM33MW

Relay RM35LV measures the levels by means of discrete sensors. These two products activate their output relay when a tank is either emptying or filling.

- A green **Un** LED indicates that the supply is on.
- A yellow **R** LED indicates the state of the output relay.
- A yellow **Tt** LED indicates that timing is in progress.
- The green and yellow LEDs flash to indicate an unacceptable setting position.

A selector switch on the front panel of these relays allows selection of the required sensitivity range and the empty or fill function. A second switch allows selection of the number of levels (1 or 2) and the type of time delay in the case of level 1 mode.

The position of these configuration switches is taken into account on energization.

- If the configuration switch is set to an unacceptable position, the product detects a fault, the output relay stays open, and the LEDs flash to signal the position error.
- If the configuration switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

### Control of two levels, empty and fill function

#### □ Fill/Empty function

#### ■ Empty function

level: 2, function:

- **LS** (Low Sensitivity: 250 Ω...5 kΩ)
- **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
- **HS** (High Sensitivity: 50 kΩ...1 MΩ)

The output relay stays open until the liquid reaches the Max. level probe. As soon as the Max. level is reached, the contact closes and allows emptying of the tank (valve opens, pump starts, etc.). When the level drops below the Min. level, the contact opens to stop the emptying process.

#### ■ Fill function

level: 2, function:

- **LS** (Low Sensitivity: 250 Ω...5 kΩ)
- **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
- **HS** (High Sensitivity: 50 kΩ...1 MΩ)

The output relay stays energized until the liquid reaches the Max. level probe. As soon as the Max. level is reached, the contact opens and the pump stops. When the level drops below the Min. level, the contact closes again and pumping re-starts to raise the level.

**Note:** When two levels are being controlled, the anti-wave time delay function is not active.

### Control of one level, empty function

#### □ Empty function T on

#### ■ Level: 1 - on delay functions:

- **LS** (Low Sensitivity: 250 Ω...5 kΩ)
- **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
- **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level rises above the probe for a time greater than the time delay value  $T_t$  set on the front panel, the relay is energized and stays energized until the liquid level drops back to the probe.

If the liquid drops back below the set level before the end of the time delay, the relay is not energized.

#### □ Empty function T off

#### ■ Level: 1 - off delay functions:

- **LS** (Low Sensitivity: 250 Ω...5 kΩ)
- **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
- **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level rises above the probe, the relay is energized instantly and stays energized until the liquid again reaches the probe level for a time  $T_t$  set on the front panel.

If the liquid drops back below the set level before the end of the time delay period, the relay stays energized.

## Operating principle (continued)

### RM35LM33MW (continued)

#### Control of one level, fill function

Fill function T on

■ Level: 1 - on delay functions:

- **LS** (Low Sensitivity: 250 Ω...5 kΩ)
- **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
- **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level drops below the probe for a time greater than the time delay value  $T_t$  set on the front panel, the relay is energized and stays energized until the liquid level rises back up to the probe. If the liquid rises back above the set level before the end of the time delay period, the relay is not energized.

Fill function T off

■ Level: 1 - off delay functions:

- **LS** (Low Sensitivity: 250 Ω...5 kΩ)
- **St** (Standard Sensitivity: 5 kΩ...100 kΩ)
- **HS** (High Sensitivity: 50 kΩ...1 MΩ)

When the liquid level drops below the probe, the relay is energized instantly and stays energized until the liquid level again reaches the probe level and stays above it for a time greater than the time delay period  $T_t$  set on the front panel. If the liquid drops back down to below the set level before the end of the time delay period, the relay stays energized.

### RM35LV14MW

A selector switch on the front panel allows selection of the function (empty or fill) and the type of sensor. A second switch allows selection of the number of levels (1 or 2) and the type of time delay in the case of 1 level mode.

The position of these configuration switches is taken into account on energization.

- If the configuration switch is set to an unacceptable position, the product detects a fault, the output relay stays open, and the LEDs flash to signal the position error.
- If the configuration switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

#### Control of two levels

Fill/Empty function

■ Empty function

Level: 2

The output relay stays open until the material reaches the Max. probe level. As soon as the Max. level is reached, the contact closes and allows emptying of the tank (valve opens, pump starts, etc.). When the level drops below the Min. probe level, the contact opens to stop the emptying process.

■ Fill function

Level: 2

The output relay stays energized until the material reaches the Max. probe. As soon as the Max. level is reached, the contact opens and the pump stops. When the level drops below the Min. probe level, the contact closes again and pumping re-starts to raise the level.

**Note:** When two levels are being controlled, the anti-wave time delay function is not active.

#### Control of one level, empty function

Empty function T on

■ Level: 1 - on delay

When the material level rises above the probe for a time greater than the time delay value  $T_t$  set on the front panel, the relay is energized and stays energized until the material level drops back to the probe. If the level rises above the probe before the end of time delay period, the relay is not energized.

Empty function T off

■ Level: 1 - off delay

When the material level rises above the probe, the relay is energized instantly and stays energized until the material level again reaches the probe and stays below it for a time greater than the time delay value  $T_t$  set on the front panel. If the level drops back to below the probe before the end of time delay period, the relay stays energized.

## Operating principle (continued)

### RM35LV14MW (continued)

#### Control of one level, fill function

□ Fill function T on

■ Level: 1 - on delay

When the material level drops below the probe for a time greater than the time delay value  $T_t$  set on the front panel, the relay is energized and stays energized until the material level again reaches the probe.

If the level rises above the probe before the end of time delay period, the relay is not energized.

□ Fill function T off

■ Level: 1 - off delay

When the material level drops below the probe, the relay is energized instantly and stays energized until the material level again reaches the probe and stays above it for a time greater than the time delay period  $T_t$  set on the front panel.

If the level drops back down to below the probe before the end of the time delay period, the relay stays energized.

- Def. Yellow LED: indicates fault present status
- Un Green LED: indicates that supply to the product is on
- R Yellow LED: indicates relay output status

## Presentation

Measurement and control relay RM35BA10 is used for control and monitoring of 3-phase and single-phase pumps.

Functions	RM35BA10
3-phase phase sequence	
3-phase phase loss	
3-phase overcurrent and undercurrent control	
1-phase overcurrent and undercurrent control	

- Function performed
- Function not performed

These control relays allow:

- Absence of one or more phases
- Undercurrent for protection against dry running
- Overcurrent for protection against overload
- Acceptance of different nominal voltage values:
  - 208...480 V ~ in 3-phase mode
  - 230 V ~ in 1-phase mode
- Clip-on mounting on a  $\lrcorner$  rail
- Monitoring of their own supply voltage measured as a true rms value

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

## Applications

- Management of pumps

## Description

### RM35BA

- 1 Configuration: selection of active function and operating mode **3-ph/1-ph** (Double - Single)
- 2 Overcurrent setting potentiometer  $> I$
- 3 Undercurrent setting potentiometer  $< I$
- 4 Time delay adjustment potentiometer  $Tt$
- 5 Starting inhibition time delay adjustment potentiometer  $Ti$
- 6 Spring for clip-on mounting on 35 mm/1.38 in.  $\lrcorner$  rail

## Operating principle

Pump control relay RM35BA10 can operate on a 1-phase or 3-phase supply and incorporates 3 functions in a single unit:

- Current control
- Phase presence control (in 3-phase mode)
- Phase sequence control (in 3-phase mode)

### Function Diagram

- Power supply off
- Power supply on
- Output 11-14, 21-24 open
- Output 11-14, 21-24 closed

These relays have two operating modes which are designed to control a pump via two external signal inputs (Y1 and Y2). These two signal inputs are controlled by volt-free contacts.

Control signal inputs Y1 and Y2 can be connected to:

- A level sensor
- A level relay
- A pressure sensor
- A pushbutton, etc.

Fault signaling is by LEDs with differentiation of the reason for the fault.

### RM35BA10

The following operating mode is selected by using a switch:

- Single control
- Double control
- 1-phase or 3-phase supply

The position of the switch and the operating mode is read by the product on energization.

- If the switch position is changed while the device is operating, all the LEDs flash, but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
- If the configuration switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

## Operating principle (continued)

### RM35BA10 (continued)

#### Single control mode

- Single control mode (3-ph/1-ph)

This mode is designed to control a pump via an external signal. The relay output is closed when the signal is present at Y1 (contact closed). Y2 can be used to reset the relay after a current fault.

**Note:** *Ti*: time delay to inhibit fault monitoring on pump starting (overcurrent and undercurrent, setting on front panel)  
*Tt*: time delay on occurrence of a fault (overcurrent or undercurrent, setting on front panel)  
*I. Def.*: presence of a current fault (overcurrent or undercurrent)

#### Double control mode

- Double control mode (3-ph/1-ph)

This mode is designed to control a pump via two external control signals (Y1 and Y2). The output relay closes when both input signals are present (Y1 and Y2 closed). It will open as soon as one of these signals disappears.

**Note:** *Ti*: time delay to inhibit fault monitoring on pump starting (overcurrent and undercurrent, setting on front panel)  
*Tt*: time delay on occurrence of a fault (overcurrent or undercurrent, setting on front panel)  
*I. Def.*: presence of a current fault (overcurrent or undercurrent)

#### 1-phase or 3-phase supply control mode

- Overcurrent detection  $I >$

- If the control relay is configured for a 1-phase supply, it monitors the current consumed by the pump.
- If the control relay is configured for a 3-phase supply, it monitors the current, phase sequence and phase loss.
- If a phase fault is detected, the output relay opens immediately.
- On energization, if there is a phase sequence or phase loss fault, the output is unable to energize.

The overcurrent and undercurrent values are set by two separate potentiometers, graduated from 1 to 10 A.

- If a setting error occurs (low threshold greater than high threshold), the output relay opens and all the LEDs flash to signal the error.
- If a current fault occurs (overcurrent or undercurrent), the relay opens when the fault persists for longer than the threshold time delay setting.
- When the current returns to the correct value, the output relay continues to remain open. It can only be re-energized by a RESET: either by switching off the power, or by closing external contact Y2 (in single control mode).
- An inhibition time delay on energization (*Ti*) allows detection of current peaks on motor starting.

**Note:** *Ti*: time delay to inhibit fault monitoring on pump starting (overcurrent and undercurrent, setting on front panel)  
*Tt*: time delay on occurrence of a fault (overcurrent or undercurrent, setting on front panel)

- Undercurrent detection  $I <$

RM35HZ21FM

**R1** Yellow LED: indicates relay status (high frequency threshold)

**Un** Green LED: indicates that supply to the product is on

**R2** Yellow LED: indicates relay status (low frequency threshold)

## Presentation

Frequency control relay RM35HZ monitors frequency variations on 50 or 60 Hz AC supplies:

Functions	RM35HZ21FM
Over-frequency (50 or 60 Hz)	
Under-frequency (50 or 60 Hz)	

- Function performed
- Function not performed

These control relays allow:

- Over-frequency and under-frequency with two independent relay outputs
- Selectable memory function
- Monitoring of their own supply voltage measured as a true rms value
- Clip-on mounting on a 35 mm rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

## Applications

Monitoring of electrical power sources:

- Generating sets, wind turbines, micro-power stations, etc.

## Description

### RM35HZ21FM

- 1 Configuration: selection of 50/60 Hz frequency range and operating mode (with or without memory) **Memory - No Memory**
- 2 Frequency tolerance multiplication setting potentiometer **x1-x2**
- 3 Low frequency threshold setting switch **F <**
- 4 High frequency threshold setting switch **F >**
- 5 Time delay adjustment potentiometer
- 6 Spring for clip-on mounting on 35 mm/1.38 in. rail

## Operating principle

Frequency control relay RM35HZ monitors:

- Frequency variations on 50 or 60 Hz supplies
- Over-frequency and under-frequency via adjustment of two independent thresholds. (It has two relay outputs: one per threshold)
- Fault signaling is by LED

### Function Diagram

	Power supply off
	Power supply on
	Output 11-14, 21-24 open
	Output 11-14, 21-24 closed

- Function selector switch:
  - Set the switch to a frequency of 50 or 60 Hz of the supply monitored, then select Memory or No memory mode.
  - The position of the switch and the operating mode is read by the product on energization.
  - If the switch is set to an unacceptable position, the product detects a fault, the output relays stay open and the LEDs flash to indicate the position error.
  - If the switch position is changed while the device is operating, all the LEDs flash but the product continues to operate normally with the function selected at the time of energization preceding the change of position.
  - If the switch is returned to the original position selected prior to the last energization, the LEDs return to their normal state.

## Operating principle (continued)

### RM35HZ21FM

The under-frequency or over-frequency threshold values are set using two graduated potentiometers indicating the variation value of the frequency to be monitored. A switch **x1/x2** allows the control scale to be doubled. Hysteresis is fixed at 0.3 Hz.

#### Over-frequency and under-frequency without memory

- Over-frequency and under-frequency control, without memory

- If the frequency of the voltage controlled exceeds the over-frequency threshold setting for a time greater than that set on the front panel (0.1...10 s), the corresponding output relay opens and its LED goes off. During the time delay, this LED flashes.

- As soon as the frequency drops below the value of the threshold setting, minus the hysteresis, the relay instantly closes.

- If the frequency of the voltage controlled falls below the under-frequency threshold setting for a time greater than that set on the front panel (0.1...10 s), the corresponding output relay opens and its LED goes out. During the time delay, this LED flashes.

- As soon as the frequency rises above the value of the threshold setting, plus the hysteresis, the relay instantly closes.

- On energization of the device with a detected measured fault, the relay stays open.

**Note:** *Tt: time delay after crossing of the threshold (adjustable on front panel)*

#### Over-frequency and under-frequency with memory

- Over-frequency and under-frequency control with memory

If "Memory" mode is selected, the relay opens after the time delay and stays in that position when crossing of the threshold is detected.

The power needs to be switched off to reset the product.

**Note:** *Tt: time delay after crossing of the threshold (adjustable on front panel)*

RM35S0MW

### Presentation

Speed control relay RM35S0MW monitors:

Functions	RM35S0MW
Underspeed (with/without memory, with inhibition by external contact S2)	
Overspeed (with/without memory, with inhibition by external contact S2)	

- Function performed
- Function not performed

Speed control relay RM35S0MW measures via:

- A 3-wire PNP or NPN proximity sensor input
- A Namur proximity sensor input
- A 0-30 V voltage input
- A volt-free contact input

These control relays allow:

- Operation with either NO or NC sensors
- Adjustable time between impulses from 0.05 s... 10 min
- Adjustable power-on inhibition time from 0.6 to 60 s
- Inhibition controlled by an external contact
- Clip-on mounting on a 35 mm / 1.38 in. rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

### Applications

Monitoring the speed or rate of rotary or linear movements in the following applications:

- conveyors/conveyor belts
- packaging
- material handling

### Description

#### RM35S00MW

- 1 Configuration: selection of operating mode: Underspeed or overspeed  
**Underspeed/Overspeed**  
with or without memory **Memory - No Memory**
- 2 Speed threshold setting potentiometer **Value**
- 3 Speed range selector switch
- 4 Starting inhibition time delay adjustment potentiometer **Ti**
- 5 Spring for clip-on mounting on 35 mm / 1.38 in. rail

RM35S0MW

**In** Yellow LED: indicates inhibition status (time delay or S2 input)

**Un** Green LED: indicates that supply to the product is on

**R** Yellow LED: indicates relay output status

#### Operating principle

Relay RM35S0MW monitors the speed (rate, frequency) of a process (conveyor, conveyor belt, etc.) using discrete sensors:

- 3-wire PNP or NPN proximity sensor
- 0-30 V voltage input
- NAMUR proximity sensor
- volt-free contact

It can be used for monitoring underspeed or overspeed.

#### Function Diagram

-  Power supply off
-  Power supply on
-  Output 11-14, 21-24 open
-  Output 11-14, 21-24 closed

#### RM35S0MW

The control relay measures the speed as follows:

- The cycle of the process being monitored is a series of impulses characterized by a two-state signal: high and low.
- The speed is obtained by measuring the period of this signal, from the detection of first change of state (either rising or falling edge).
- Digital processing of the signal allows the disparity between the signals to be calculated.
- On energization or after appearance (or reappearance) of the sensor signal, detection (characterization) of the signal requires processing of one or two periods. During this time, control is inoperative.

The operating modes are selected by using the switch:

- Underspeed without memory
- Underspeed with memory
- Overspeed without memory
- Overspeed with memory

#### Underspeed control without memory

- Underspeed control, without memory

At the end of the starting inhibition time delay "Ti", as soon as the speed measured drops below the threshold setting, the output relay changes state from "closed" to "open".

It returns to its initial state when the speed is again higher than the threshold plus hysteresis (fixed at 5% of the threshold setting).

When power is restored, after a break having lasted at least 1 s, the relay is in the "closed" state during the time delay and stays in that state for as long as the speed remains higher than the threshold.

#### Underspeed control with memory

- Underspeed control, with memory

When relay RM35S has been configured in "memory" mode, if underspeed is detected, the output relay stays in the "open" state, irrespective of any further changes in the process speed.

It will not be able to return to the "closed" state until contact S2 closes (for at least 50 ms).

If, when S2 re-opens, the speed is not high enough, the relay returns to "open" state. Relay RM35S can also be reset by a power break (at least 1 s); the relay then returns to the "closed" state for at least the duration of the time delay, irrespective of the process speed.

#### Operating principle (continued)

##### RM35S0MW

##### Underspeed control with inhibition by S2

- With inhibition by S2 **Inhib./S2**

On energization, to allow the process being monitored to reach its nominal operating speed, relay RM35S is inhibited for a time delay adjustable from 0.6...60 s. This time delay can be adjusted (shortened or lengthened) during inhibition.

Relay RM35S can also be inhibited by closing of contact S2: on starting, for example, if the process run-up to speed time is greater than 60 s, or at any time during operation.

Whether it results from a starting inhibition time delay or closing of S2, inhibition keeps the output relay in the “closed” position and is signaled by illumination of the inhibition LED.

If, after lifting of inhibition (end of starting inhibition time delay or opening of contact S2), the signal detection phase has not been completed, the relay drops out after the set wait time between two impulses (measured from the end of inhibition).

Inhibition should last as long as is necessary for the product to detect at least 2 periods.

When the signal has not been ‘characterized’ by the end of the inhibition period, the “inhibition” LED flashes for as long as speed measurement is impossible.

It is also possible to inhibit relay RM35S at any time, during operation, by closing S2.

##### Overspeed control without memory

- Overspeed control, without memory

At the end of the starting inhibition time delay, “Ti”, as soon as the speed measured is higher than the threshold setting, the output relay changes state from “closed” to “open”.

It returns to its initial state when the speed is again lower than the threshold minus hysteresis (fixed at 5% of the threshold setting).

When power is restored to relay RM35S, after a break having lasted at least 1 s, the relay is in the “closed” state during the time delay and stays in that state for as long as the speed remains lower than the threshold.

##### Overspeed control with memory

- Overspeed control, with memory

When relay RM35S has been configured in “memory” mode, if overspeed is detected, the output relay stays in the “open” state, irrespective of any further changes in the process speed.

It will not be able to return to the “closed” state until contact S2 closes (for at least 50 ms).

If, when S2 re-opens, the speed is too high, the relay returns to the “open” state.

Relay RM35S can also be reset by a power break (at least 1 s); the relay then returns to the “closed” state for at least the duration of the time delay, irrespective of the process speed.

## Operating principle (continued)

### RM35S0MW

#### Overspeed control with inhibition by S2

□ With inhibition by S2. **Inhib./S2**

On energization, in order to allow the process being monitored to reach its nominal operating speed, relay RM35S is inhibited for a time delay adjustable from 0.6...60 s. This time delay can be modified (shortened or lengthened) during inhibition.

Relay RM35S can also be inhibited by closing of contact S2: on starting, for example, if the process run-up to speed time is greater than 60 s, or at any time during operation.

Whether it results from a starting inhibition time delay or closing of S2, inhibition keeps the output relay in the "closed" position and is signaled by illumination of the inhibition LED.

If, after lifting of inhibition (end of starting inhibition time delay or opening of contact S2), the signal detection phase has not been completed, the relay drops out after the set wait time between two impulses (measured from the end of inhibition).

Inhibition should last as long as is necessary for the product to detect at least 2 periods. When the signal has not been 'characterized' by the end of the inhibition period, the "inhibition" LED flashes for as long as speed measurement is impossible.

It is also possible to inhibit relay RM35S at any time, during operation, by closing S2.

# Zelio Control Relays

Temperature control relays for elevator machine rooms and 3-phase supplies  
RM35ATL, RM35ATR, and RM35ATW

RM35AT0MW

## Presentation

Measurement and control relays RM35ATL0MW, RM35ATR5MW and RM35ATW5MW are designed for monitoring the temperature in elevator machine rooms, in compliance with directive EN81.

Functions	RM35ATL0MW	RM35ATR5MW	RM35ATW5MW
Overtemperature (34...46 °C)			
Undertemperature (-1...11 °C)			
Phase sequence			
Phase loss			

- Function performed
- Function not performed

These control relays allow:

- PT100 input
- Adjustable control around 5 °C and 40 °C
- Independent adjustment of high and low thresholds
- Possibility of integrated phase control
- Clip-on mounting on a  $\text{U}$  rail

They feature:

- A sealable cover to help protect the settings
- A control status indicator LED

## Applications

- Temperature control for elevator machine rooms

## Description

### RM35ATL0MW, RM35ATR5MW

- 1 High temperature threshold setting potentiometer  $\theta >$
- 2 Potentiometer for adjustment of time delay on crossing of temperature threshold  $Tt$

Temperature control relays for elevator machine rooms  
and 3-phase supplies  
RM35ATL, RM35ATR, and RM35ATW

## Operating principle (continued)

### RM35ATL0MW

#### Temperature control by PT100 probe

- Temperature control by PT100 probe

After a delay on pick-up after energization, and for as long as the temperature monitored by the PT100 probe remains between the two thresholds set on the front panel, the output relay is closed and the yellow LEDs are on.

When the temperature crosses one of the threshold settings on the front panel (high or low threshold), the time delay set on the front panel ( $T_t$ ) is activated. The yellow LED corresponding to the threshold crossed (low or high) flashes.

At the end of the time delay, if the temperature is still outside the threshold setting, the output relay opens and the yellow LED corresponding to the threshold crossed goes out. The output relay closes instantly (within the response time on disappearance of a fault) when the temperature returns within the window of the two threshold settings on the front panel, plus the fixed hysteresis.

If the PT100 probe is incorrectly wired (missing or short-circuited) the relay is open and the 3 LEDs flash.

**Note:**  $T_t$ : time delay after crossing of the temperature threshold (adjustable on front panel)

### RM35ATR5MW

#### Temperature control by PT100 probe

- Temperature control by PT100 probe

After a delay on pick-up after energization, and for as long as the temperature monitored by the PT100 probe remains between the two threshold settings on the front panel, the output relays are closed and their yellow LEDs are on.

When the temperature crosses one of the threshold settings on the front panel (high or low threshold), the time delay set on the front panel ( $T_t$ ) is activated. The yellow LED corresponding to the threshold crossed (low or high), flashes.

At the end of the time delay, if the temperature is still outside one of the threshold settings, the corresponding output relay opens and the yellow LED corresponding to the threshold crossed goes out.

The output relay closes instantly (response time on disappearance of a fault) when the temperature returns within the window of the two threshold settings on the front panel, plus (or minus) the fixed hysteresis.

If the PT100 probe is incorrectly wired (missing or short-circuited) the relays are open and the 3 LEDs flash.

**Note:**  $T_t$ : time delay after crossing of the temperature threshold (adjustable on front panel)

### RM35ATW5MW

#### Temperature and phase control

- Temperature control by PT100 probe
- Sequence of phases L1, L2, and L3
- Phase loss

After a delay on pick-up after energization, and for as long as the temperature monitored by the PT100 probe remains between the two threshold settings on the front panel, the temperature relay R1 is closed.

When the temperature crosses one of the threshold settings on the front panel (high or low threshold), the time delay set on the front panel ( $T_t$ ) is activated. The yellow temperature LED flashes. At the end of the time delay, if the temperature is still outside the threshold setting, the output relay R1 opens and the yellow LED goes out.

The output relay R1 closes instantly when the temperature returns to within the window of the two threshold settings on the front panel, plus or minus the fixed hysteresis. The device also monitors the correct sequence of phases L1, L2, and L3 of the 3-phase supply and total phase loss, even in the case of phase regeneration (< 70%).

After a delay on pick-up after energization, and for as long as phase presence and phase sequence are correct, relay R2 and the "phase" LED are On. When a fault appears, the "phase" relay opens and the "phase" LED instantly goes out (response time on appearance of a fault).

When the fault disappears, the phase control relay and LED are activated (response time on disappearance of a fault).

If the PT100 probe is incorrectly wired (missing or short-circuited) relay R1 is open and LED R1 flashes.

**Note:**  $T_t$ : time delay after crossing of the temperature threshold (adjustable on front panel)
